

## **Wyndham Grand İzmir Özdilek Thermal & Spa Fire Prevention and Suppression Systems**

Our hotel is equipped with a Fire Alarm System that can notify the relevant teams first and then all our guests in case of a potential fire. Heat and smoke detectors are installed throughout the building to monitor all areas.

To counter potential fires, automatic fire suppression systems are in place across all areas. Our sprinkler system, present in all sections of the building, is designed to automatically extinguish fires with water in the affected area.

Fire cabinets are located every 25 meters within the building. These cabinets contain hoses and fire extinguishers for water-based firefighting. Additional fire extinguishers are also placed in various locations as needed. Moreover, emergency exit plans are available in all common areas and guest rooms.

Kitchen areas undergo periodic duct cleaning, and the exhaust hoods are equipped with automatic fire suppression systems to prevent potential fire hazards.

The building has three fire escape staircases, which are designed to safely evacuate guests and staff. These staircases are isolated from heat and smoke through a positive pressure system and fire-resistant doors.

All systems undergo regular internal and external maintenance, and independent accredited organizations inspect them to ensure their reliability and efficiency.
